We would connect an external signal source (0-3V range from a sensor) to the TPR2420. What are the correct pins and polarity to use for connection? (is the picture above correct?).
And if we have more than one external source? (for example 8 signal sources?)
Is it available an electric scheme or hardware manual for TPR2420 with cabling description? We searched it but we did not find it. Can you send us informations and details about pin connections for external sensors?
Thank you in advance.
Best regards.
